

I built a menu-driven Personal Expense Tracker in Python. Each expense is a dictionary in a list with date, category, amount, and description.

Example shape:

```
{'date': '2024-09-18', 'category': 'Food', 'amount': 15.50, 'description': 'Lunch with friends'}
```

Menu:

1. Add expense,
2. View expenses,
3. Track budget,
4. Save expenses,
5. Exit.

Add asks for YYYY-MM-DD, category, amount, and a short description, then appends to the list in memory. It does not write the CSV until Save or Exit, because the spec gave Save its own option. View loops the list and prints those four fields. Incomplete rows are skipped with a note.

Track budget asks for a monthly amount, totals this month's complete expenses (*total_spent_this_month*), then either prints "You have exceeded your budget!" or how much is left for the month. `load_expenses` runs at start and reads *expenses.csv*, *save_expenses* writes date, category, amount, description as CSV rows. Option 5 saves then quits.

Run:

open the *personal_expense_tracker* folder and use `python personal_expense_tracker.py`. I checked bad dates (rejected), add/view, leftover budget (500 vs 200 spent), over-budget (600 vs 500), and save/load.

I did not save the budget to a file. The problem statement only asked to save expenses.
